

Value Flows bridge the gap between Operations and Finance & Controlling

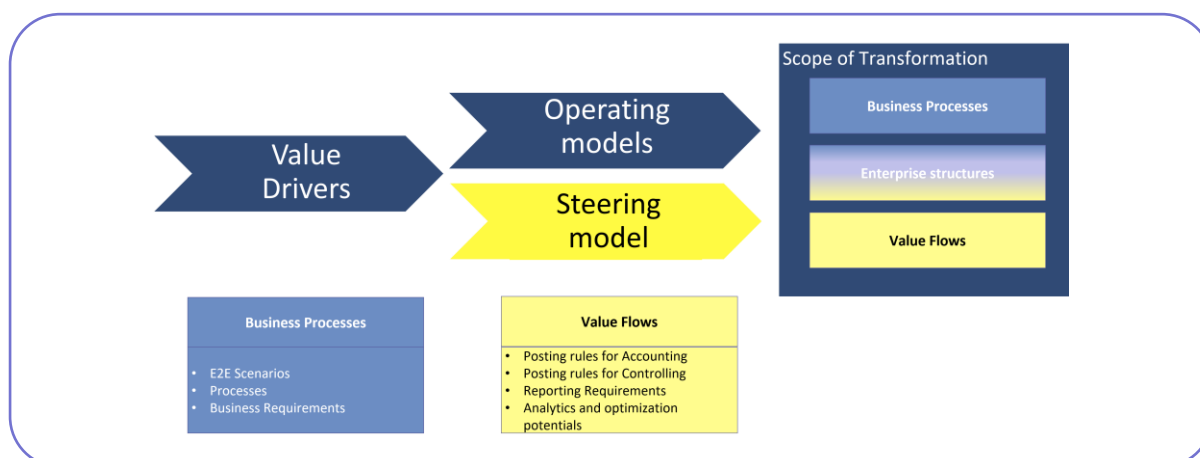

We use Value Flows in our Business Flows reference model to demonstrate the real-live integration of business and accounting aspects of enterprise processes. We have compiled relevant content from decades of project experience and modeled these based on established standards. First started as an internal toolbox and training facilitator, our model has reached a maturity we are confident to share externally and that is valued by numerous subscription customers. Based on our profound insight in financial accounting and controlling, and enterprise architectures, we have a concise and pragmatic methodology for establishing cross references between key Value Flow topics (e.g.: COGS, inventory and revenue postings), and the relevant E2E scenarios.

Value Flows are a pivotal part of our **model-based Value Driven Business Transformation** approach. Value Driven Business Transformation ensures seamless process design and systems implementation through early alignment between operations and Finance & Controlling on key

aspects of the business including financial steering, operating models, end to end scenarios and value flows. This integrated and aligned business transformation approach couples the separated views of operations and accounting. It empowers you to steer your business better by orchestrating operating models, value flows and management reporting and analytics.

Our model-based approach for business transformation

Our Accelerators for business transformation

- Value drivers mapped to KPI and end-to-end scenarios showing how the steering model relates to operating models
- Reference process flows across various areas from sales, to procurement, to production
- Value flow postings showing how operational processes impact accounting and controlling
- Reference posting rules, reporting requirements, and assessment of analytics and optimization potentials

Our Services

- Derive value drivers from transformation objectives
- Analyze/Detail steering and operating models
- Derive value flow concept per end-to-end domain
- Design integrated enterprise structure
